

# **Making a New CCmaps Project**

**By**

**Daniel B. Carr**

## **1. Introduction**

Making a new CCmaps project is easiest when there is a CCmaps project available with the region boundary files that you want to use. Section 2 discusses the needed data file structure. Section 3 discusses creating a new project using the new data file. Section 4 comments of the use of pathnames in the project file. A separate document discusses boundary files used in CCmaps.

## **2. CCmaps Data File Structure**

This should be comma delimited (.csv) or white space delimited (.txt) data file. (In white space delimited files character strings with embedded blanks need to be surrounded by quotation marks.)

The first row should be variable names. After this, there should be one row for each region with data. Regions with some missing data can be included. In comma delimited files the absence of values relative to commas indicates missing data. CCmaps treats NA as the missing data code in white space delimited files.

The first column needs to use the same region identifier that is used in the region boundary file. For example, state identifiers are likely the standard state names, two letter state abbreviations, two digit state FIPS codes. CCmaps read first column entries as character strings. Except for the first row of variables names, CCmaps reads all columns but the first column as numeric columns.

## **3. Creating a new project **using existing boundary files****

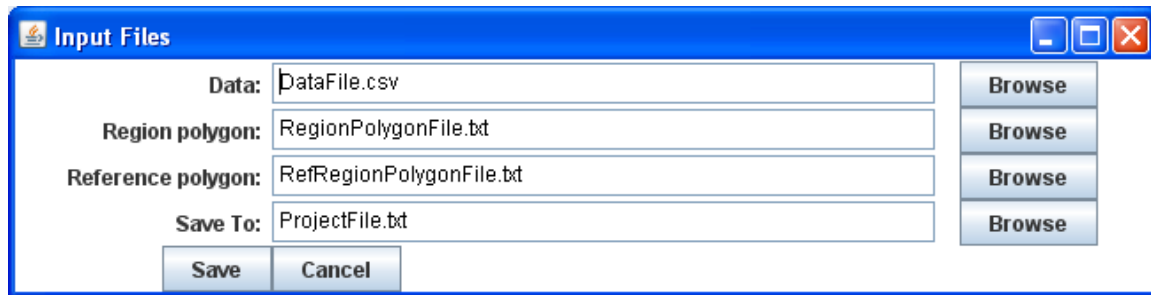

With a new data file that has these same regions in the left column, there are two approaches to preparing a new application. The first uses the CCmaps New option under the File menu as described in Section 3.1 **The second approach, described in Section 3.2 on page 5, is to rename and the edit an existing application control text file:** replace the data file name, modify the variable selection line, and delete the variable descriptor lines at the bottom the file.

### 3.1 Using the CCmap New option under the File Menu

Select New

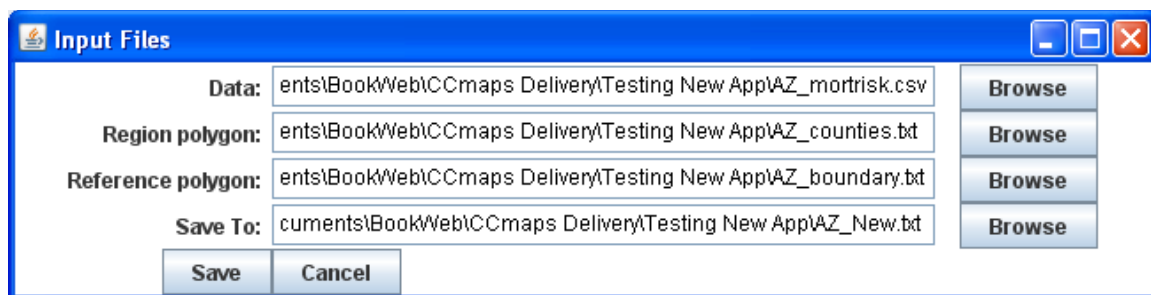

The following window appears

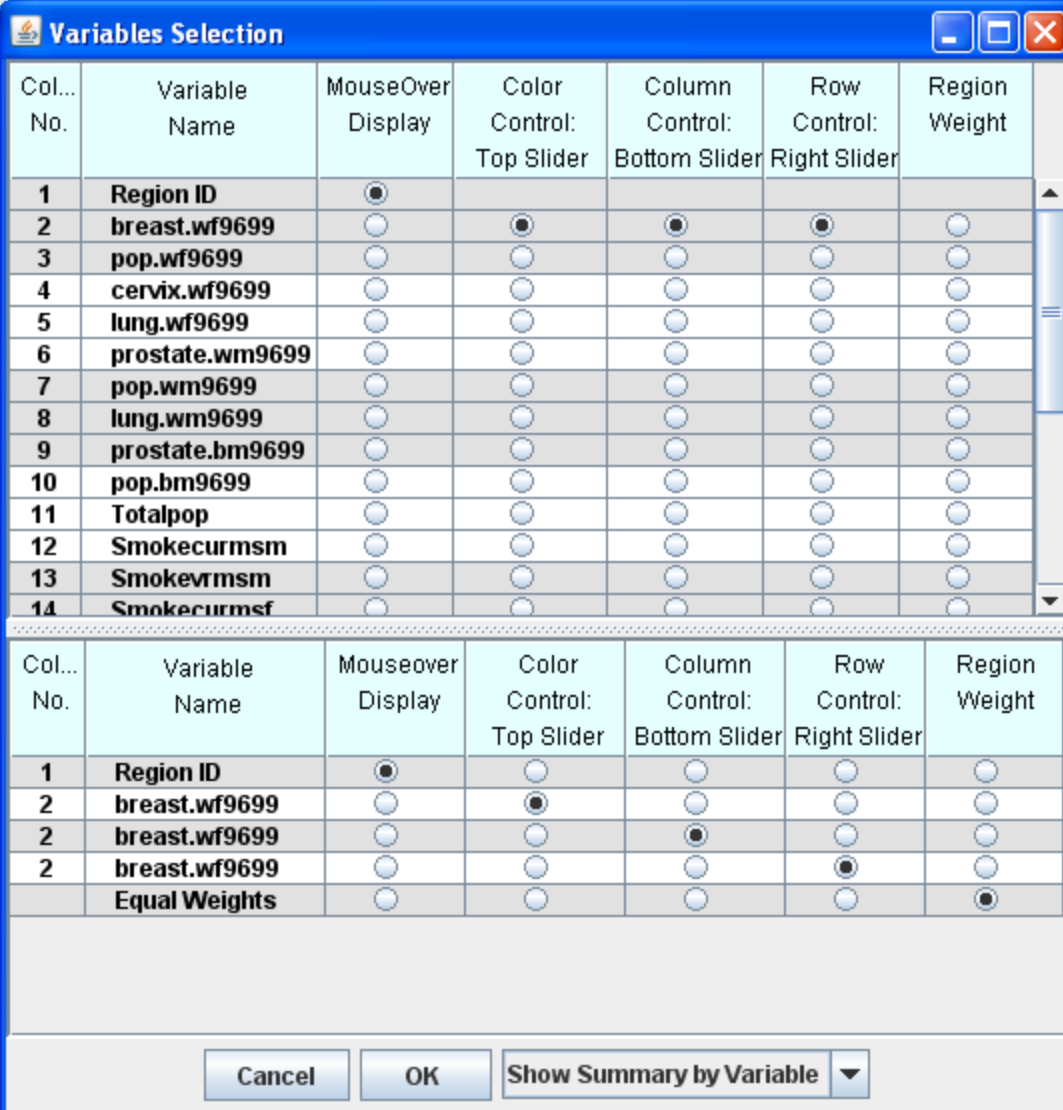

Before responding to this window I suggest putting a copy of the previous application files in a new folder with the new data set. This includes the project control file.

The above asks for three input files: the data, region polygon and reference region polygon files. **The region polygon file can be entered a second time as the reference region polygon file if there is no reference region polygon file.** The reference region polygon boundary lines plot on top of the map of color filled regions. This allows, for example, state outlines to be plotted in a different color on US county map. Use the browser to specify the new data file and the polygon file(s) in the new folder. This will include the path to the files.

Use the browser to select the old project file and rename the file if you want but keep the path. You will be asked if you want to overwrite the file. This is fine if it a copy in the new folder. **Then select save.** A variable picker will appear with the variables from you new file. An example picker with variables appears below.

The dialog box is titled "Variables Selection". It contains two tables. The first table has 7 columns: "Col... No.", "Variable Name", "MouseOver Display", "Color Control: Top Slider", "Column Control: Bottom Slider", "Row Control: Right Slider", and "Region Weight". It lists 14 variables. The second table has the same 7 columns and lists 5 items, including "Equal Weights". At the bottom are buttons for "Cancel", "OK", and "Show Summary by Variable" with a dropdown arrow.

Col... No.	Variable Name	MouseOver Display	Color Control: Top Slider	Column Control: Bottom Slider	Row Control: Right Slider	Region Weight
1	Region ID	<input checked="" type="radio"/>				
2	breast.wf9699	<input type="radio"/>	<input checked="" type="radio"/>	<input checked="" type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
3	pop.wf9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
4	cervix.wf9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
5	lung.wf9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
6	prostate.wm9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
7	pop.wm9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
8	lung.wm9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
9	prostate.bm9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
10	pop.bm9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
11	Totalpop	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
12	Smokecurmsm	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
13	Smokevrmsm	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
14	Smokecurmsf	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

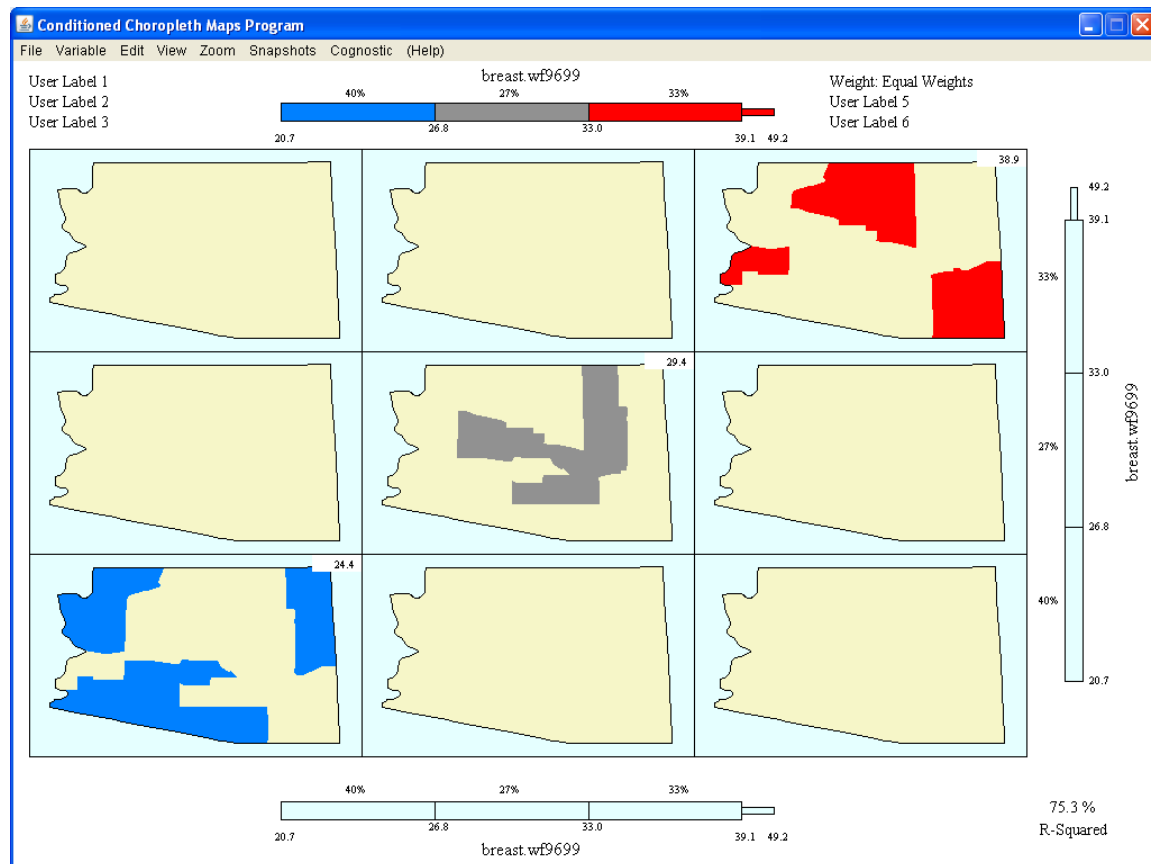

Col... No.	Variable Name	Mouseover Display	Color Control: Top Slider	Column Control: Bottom Slider	Row Control: Right Slider	Region Weight
1	Region ID	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
2	breast.wf9699	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
2	breast.wf9699	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
2	breast.wf9699	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
	Equal Weights	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>

Cancel
OK
Show Summary by Variable ▼

By default the picker attaches the variable in the second column to all three sliders and selects equal weights (from the bottom of the scrollable list). The part of the window at the bottom four files provide a summary of the choices.

Click the button in the variable row and slider color to attach the variable to the slider. Do this for each slider. If you want region weighted statistics click the button in the variable row and the region weight column on the right. Then click OK at the bottom of the summary.

The 3 x 3 map should appear.

Even though this needs fixing I would use the file menu to **save a new project file with an appropriate name in the new folder to capture the progress.** You can use then use open option under the file to read in the saved control file if need.

You can begin making things better with the menus or start exploring with the sliders. The edit menu lets you make thing better by change colors and region outline colors, Replace the User Labels with something meaningful and you may want to change the the scale limits for the map panels to adjust the aspect ratio of the maps.

**Saving the project file again will capture your improvements and slider settings.**

You can overwrite the old file or provide a new name when you want more than one view. The Snapshot menu can save an annotated sequence of views. the CCmaps Menu document describes and the other menu options.

### 3.2 Hand editing an existing application control file to create a new project.

Save an existing application control file with a new name and then edit this new file. An example file appears in the box below with color links to the changes.

Replace the Region\_data **file name**. Replace the **Var\_Select\_Order** line near the bottom.

**Remove all of the column lines below that line.**

You can end the left and right top label in CCmaps. If you edit them now **do not remove the keywords** on the left.

```

In CCmaps use Open under the file menu to open the new application control file. Select Picker under the Variable menus to select the slider variables. If more information is needed about the Picker menu see the text below the variable picker shown in section in 3.1 above.

You should be able to use the CCmaps features change variables names, tail thresholds, and colors. Save the control file to keep these changes and used different control files Names if there are multiple versions that you want. Note that the Snapshot menu allows saving different map views based on slider settings changes or map enlargements as well as alternative views like scatterplot smoothes. The named live snapshot views are save and restored under the Snapshots menu in a file that associate with the control file. This is often more convenient than saving a new control file for interesting change in slider setting.

#### **4. Opening applications and Path Names**

The second input window in Section 3.1 has long path names in front of the file names. The long pathnames are saved in the project file. The pathnames may be convenient when the same boundary files are used by many projects. There is no need for multiple copies.

If all the needed files are in one folder, the pathnames are not needed in the project file. CCmaps provide access to the project file via the open option under the File Menu. CCmaps will look for files in that folder if they don't have pathnames. Editing out the pathnames (none appear in the 2.3 example above) allows the folder to be moved to a different computer and still work.
